

COSMOS in the 2020s: Helping to Unveil the Nature of Dark Energy

Dan Masters

Jet Propulsion Laboratory / California Institute of Technology

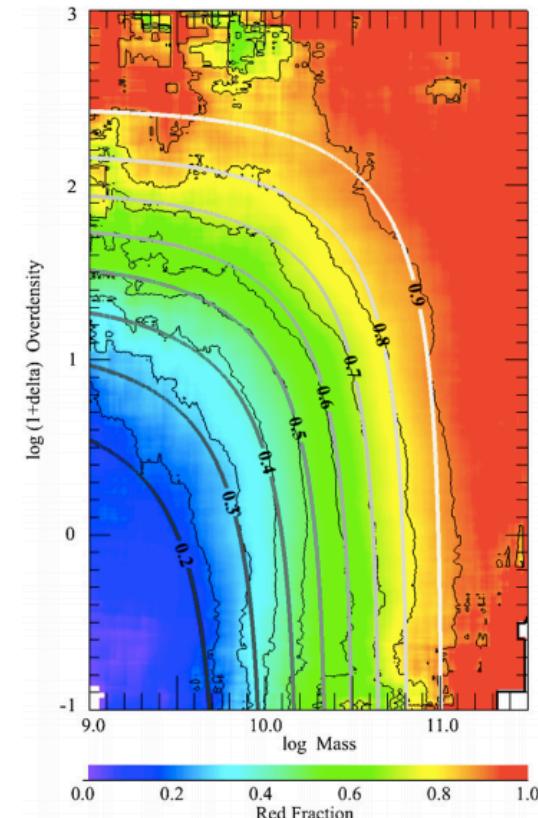

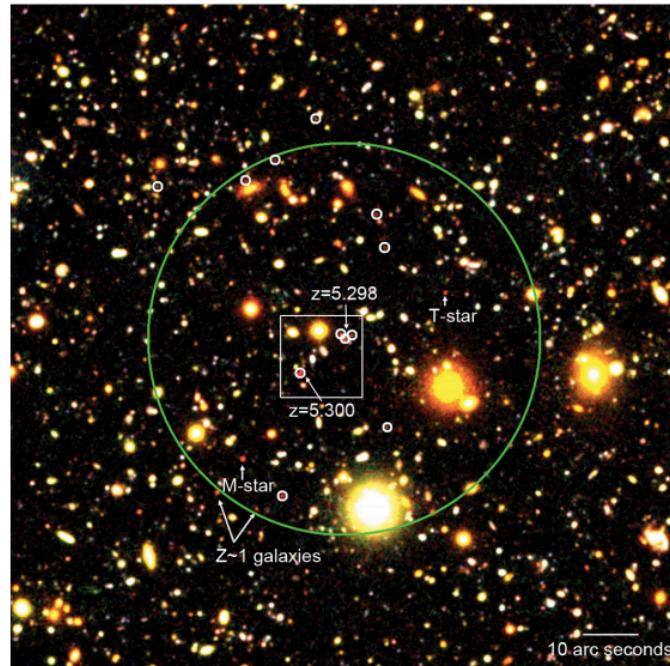

On behalf of the COSMOS & C3R2 teams

COSMOS: A Spectroscopy Goldmine

- Major surveys targeting the field:
 - zCOSMOS, DEIMOS 10k, MOSDEF, LEGA-C, IMACS, CLAMATO...
- >50,000 galaxies with high-quality spectra
- +30 band (low-res spectral) data on everything!
- COSMOS has enabled some of the most detailed studies of galaxy evolution ever

Spectroscopic Legacy

- Wonderful results from the field:
 - Peng, Lilly et al. 2010 – the mass and environment dependence of quenching
 - Discovery and characterization of the earliest proto-cluster (Capak et al. 2011)
 - ALMA follow-up studies (Faisst et al. 2018)

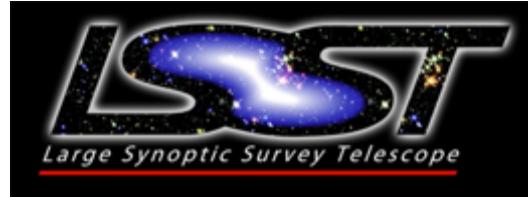

The 2020s: Cosmology & Dark Energy

- This decade will be characterized by deep surveys (Euclid, WFIRST, LSST) over 1000s of square degrees
- The primary goal of these experiments is to shed light on the nature of dark matter and – especially – dark energy

“Dark energy is not only terribly important for astronomy, it's the central problem for physics.”
-Steven Weinberg

Upcoming Dark Energy Missions

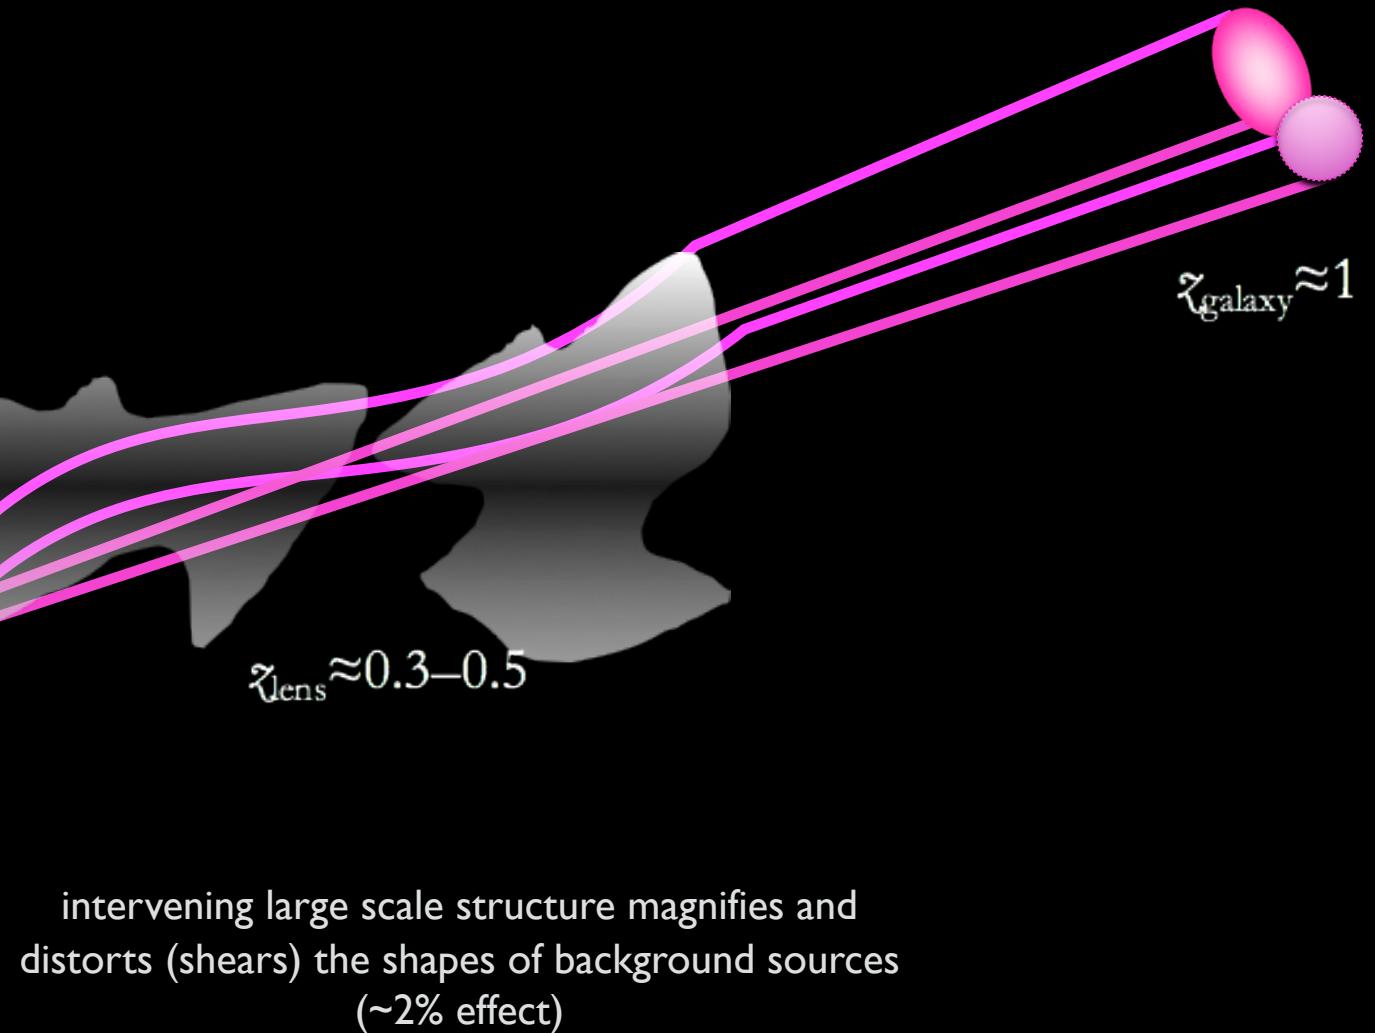

| Proposed lifetime | 2022 - 2032 | 2022 - 2028 | 2025 - 2031 |
|----------------------|--------------------------|---------------------|-------------|
| Mirror size (m) | 6.5 (effective diameter) | 1.2 | 2.4 |
| Survey size (sq deg) | 20,000 | 15,000 | 2,227 |
| Median z (WL) | 0.9 | 0.9 | 1.2 |
| Depth (AB mag) | ~27.5 | ~24.5 | ~27 |
| FoV (sq deg) | 9.6 | 0.5 (Vis) 0.5 (NIR) | 0.28 |

Probes of the Structure Formation: Weak Gravitational Lensing

$z_{\text{observer}} = 0$

intervening large scale structure magnifies and
distorts (shears) the shapes of background sources
(~2% effect)

2020s: Wide surveys, limited information

- Incredible requirements placed on the systematics of large scale surveys
 - Galaxy shapes and redshift distributions must be measured extremely well
- Billions of galaxies in the weak lensing shear samples
 - Redshifts must be inferred from broad-band imaging data
 - Individual redshifts will have large error, but redshift statistics of populations must be known with high accuracy
- Deep fields with extensive ancillary data are key to understanding the wide field data produced by WFIRST/Euclid/LSST

COSMOS: A Wealth of Information

- Photometric data across the EM spectrum
 - Radio through X-ray, with intermediate and narrow-band data in the optical/near-IR
- Spectra to calibrate photometric redshifts
- One of the key calibration fields for the upcoming Stage IV surveys
 - LSST deep drilling field
 - Euclid calibration field

C3R2 = Complete Calibration of the Color-Redshift Relation

→ A large Keck Program to prepare for Stage IV Dark Energy Experiments

Judith Cohen (Caltech) - PI of Caltech Keck C3R2 allocation

16 nights (DEIMOS + LRIS + MOSFIRE)

Daniel Stern (JPL) - PI of NASA Keck C3R2 allocation

10 nights (all DEIMOS; “Key Strategic Mission Support”)

Daniel Masters (JPL) – PI of NASA Keck C3R2 allocation 2018A/B, 2019B, 2020A

16 nights (8 each LRIS/MOSFIRE; “Key Strategic Mission Support”)

Dave Sanders (IfA) - PI of Univ. of Hawaii Keck C3R2 allocation

6 nights (all DEIMOS) + H₂O

Bahram Mobasher (UC-Riverside) - PI of UC Keck C3R2 allocation

2.5 nights (all DEIMOS)

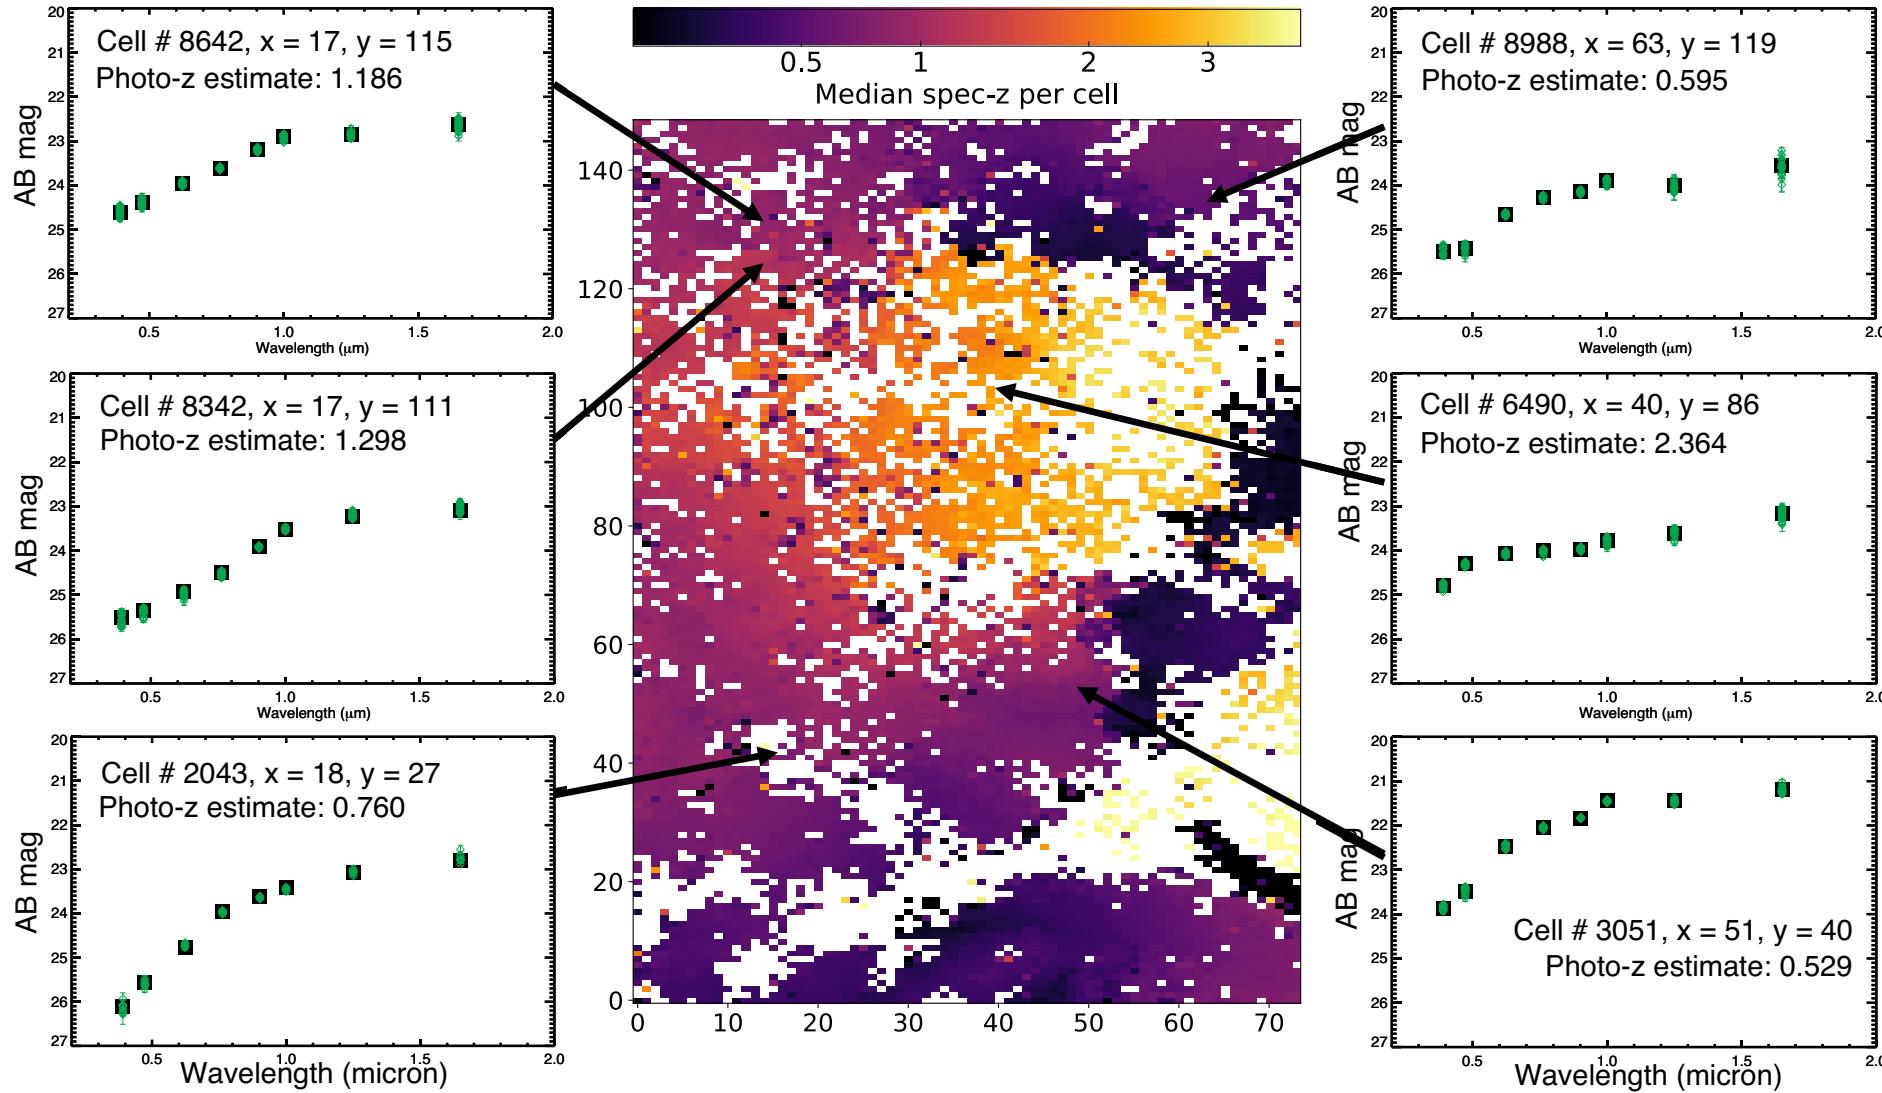

+ time allocations on VLT (PI F. Castander), MMT (PI D. Eisenstein), and GTC (PI C. Guitierrez)

-Coordinating closely with these collaborators for these observations

-Sample drawn from 6 fields totaling ~6 deg²

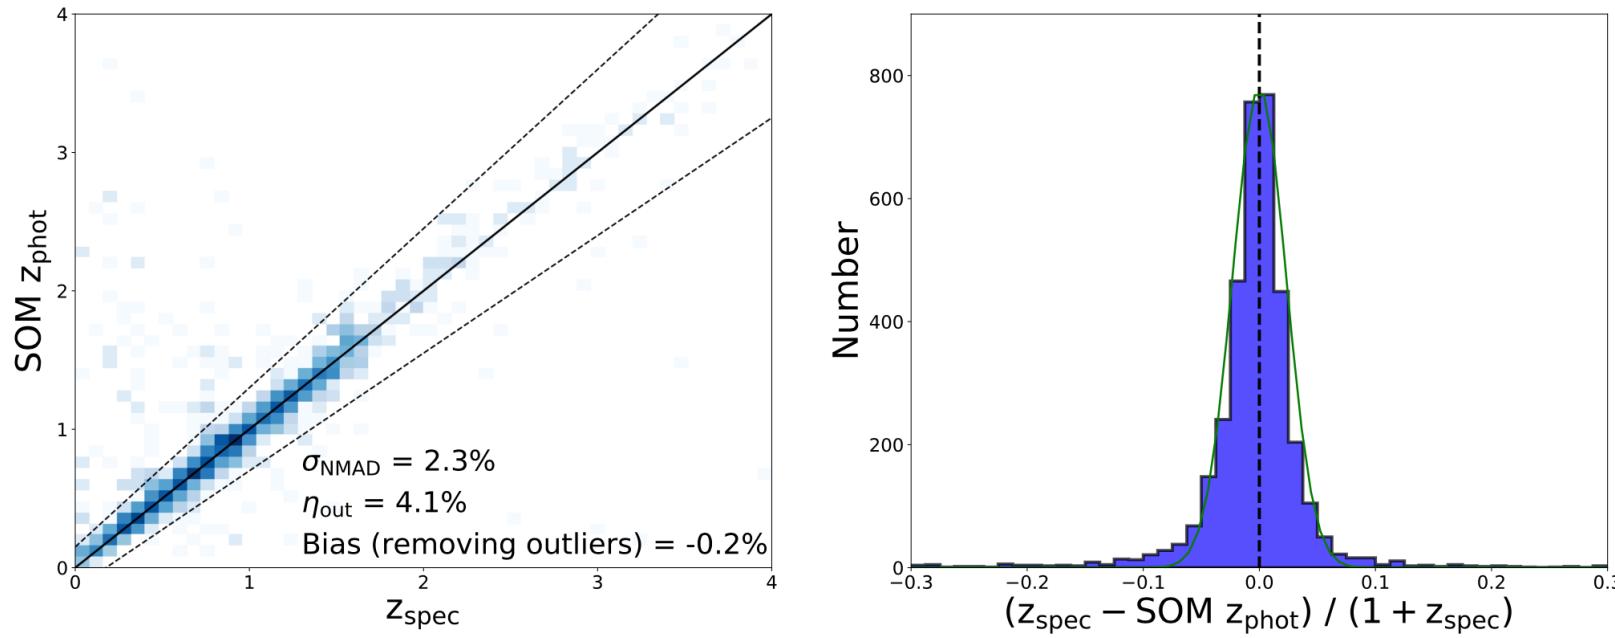

Additional Collaborators: Peter Capak, S. Adam Stanford, Nina Hernitschek, Francisco Castander, Sotiria Fotopoulou, Audrey Galametz, Iary Davidzon, Stephane Paltani, Jason Rhodes, Alessandro Rettura, Istvan Szapudi, and the Euclid Organization Unit – Photometric Redshifts (OU-PHZ) team

The 8-color SOM to Euclid depth

SOM-based redshift performance

- Simple test: Use position on SOM to predict photo-z
 - Incorporate nothing in defining $P(z|C)$ relation other than the median deep survey photo-z in cells of the Euclid/WFIRST color space

- Outlier fraction 4.7%, bias (after removing outliers) of 0.18%

Masters et al. 2019 ApJ 877, 81

Summary

- COSMOS will remain a premier field through the 2020s for characterization and calibration of deep field data
- The wealth of spectroscopic and photometric information in COSMOS is a Rosetta Stone needed to interpret the data from wide area surveys of the 2020s aimed at uncovering the nature of dark energy
- C3R2 survey is complementing the already extensive spectroscopic coverage in the field to map the galaxy color-redshift relation
- Expect great things to come!
